**Notes to Editors**

**About e-Therapeutics**

e-Therapeutics plc pioneered network pharmacology in drug discovery. It has developed proprietary systems to swiftly and accurately analyse and predict how medicines interact with cells in the body. This optimises the probability of identifying

drug candidates with desirable efficacy and low toxicity. The Company applies its novel, systematic approach to three areas of activity:

- discovery of new drugs;
- discovering novel uses for existing drugs; and
- analysis of the interactions between different drugs.

Amongst e-Therapeutics' pipeline of compounds in development are novel antibiotics that have been shown to kill the "superbug" MRSA and C.difficile, and a novel cancer chemotherapy that has been shown to kill malignant cells at safe doses in a very short time. Other candidate therapies in development are targeted at atherosclerosis, asthma and depression. The Company is currently in negotiation with a number of pharmaceutical companies, and is progressing the preclinical and clinical development of these products, two of which have completed Phase II trials successfully, and three of which have been out-licensed to pharmaceutical partners.
